ADD-Task Next Generation Intelligence Reporting Platform

Having identified the European need for intelligent incident management systems that are customizable, ADDITESS ADD-Task <https://aditask.com/> is an end user driven solution designed to fit this gap. In particular, the solution combines a multitude of functionalities that cover a wide range of requirements whilst allowing full control over the generated data. ADD-Task is characterised by its modularity and ability to create customised solutions based on the requirements and imposed constraints; the solution can then be deployed either on a private cloud or on premises. Considering that no solution fits it all, ADD-Task is available in three editions, each targeting a different audience, however the modularity and configurability of its functionalities allow for custom-made editions to cover the particular needs of other application domains. ADD-Task provides different editions for Community Policing (ADD-Task edition), local authorities and enterprise applications (such as that ADD-Marine edition for Marinas/Ports) each of which equipped with functionality specially designed for the needs of each application area.

“Users will make better decisions if they have the relevant and accurate information in the appropriate way, and at the appropriate time”.

ADD-Task is heavily assisted by advanced technological tools capable of operating in real-time, achieving secured and targeted communication between involved stakeholders, whilst breaking down the barriers separating user roles and agencies from the public. Simultaneously, advances are also provided in aspects relevant to the development of coordinated service delivery to partners. ADD-Task also provides a seamless interface to legacy systems for information transmission to relevant organisations.

The design of the ADD-Task architecture follows a loosely coupled architecture allowing for modularity and flexibility. This is thought to be essential as ADD-Task captures the diverse governing practices of the different countries by deploying state of the art methods for software design as well as privacy by design principles. ADD-Task is not just about incident reporting, several architectural components exhibit intelligence that allow the spatiotemporal and contextual correlation of reports, producing investigative knowledge and report aggregation in instances where multiple reports are found to be describing the same incident. ADD-Task is not aiming at replacing the operator but rather to provide credible information that would otherwise take precious human resources in acquiring.

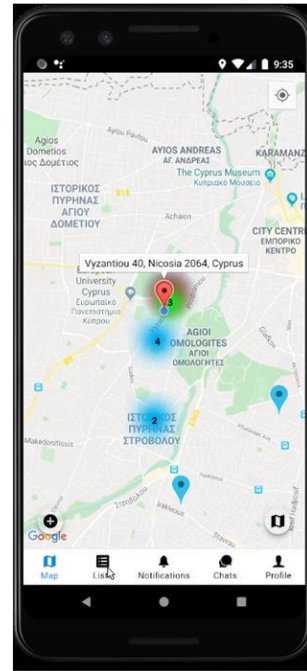

ADD-Task consists of modules, each adding functionalities to the platform: a central management system with interoperability interfaces, a data fusion engine, a spatiotemporal correlation engine and web based and mobile user terminals.

ADD-Task Functionalities:

- Real time incident reporting and event management with instant notification issuing of involved parties

The graphic features the ADDITESS logo at the top left, with the tagline 'Advanced Integrated Technology Solutions & Services'. The main headline reads 'An incident reporting and awareness tool built for real-time engagement within one central system'. Below this, a cityscape is overlaid with red location pins. The central text 'NEXT GENERATION INTELLIGENCE' is followed by a descriptive paragraph: 'With the adITASK app, users can view nearby incidents or report their own events, have them assigned to appropriate teams or agencies and receive instant status and progress updates. No more waiting as all messages are responded to in real-time, all from a single interface.' Six functional icons are displayed in a grid: Reporting (instant reporting, prioritisation and event management), Engagement (chat & reply with gestures through text, photos, video and audio), Tracking (real time progress tracking, task and message generation), Support (technical level support and incident assignment), Geolocation (Geo mapping, live location and heat maps), and Statistics (Operational insights and business intelligence). Contact information at the bottom includes phone number (+357 22 250 959), email (info@aditask.com), website (aditask.com), and address (A. Byzantliou 40, 2054, Nicosia, Cyprus), along with a QR code.

- Early warning and alerting mechanisms
- Support event prioritization through a risk taxonomy
- Automated message generation and real-time progress tracking
- Resource management and task allocation
- Dual communication with the transmission of text and multimedia messages
- Tactical level support through real time data correlation and full duplex communication
- Aggregated data view in 3D GIS enabled environment (2D + Time) with the ability to interface with third-party systems.
- Annotation of POIs (Points of Interest) and ROIs (Regions of Interest).
- Strategic level support through Business Intelligence analytics and data mining
- Secured data delivery & storage
- Integration with third-party & legacy sensors
- User management and access rights

 A screenshot of the adiTASK web application interface. The interface is divided into several sections:

- Task Details:** Shows information for task ID 120150220-3, categorized as 'WARNING' and 'COMPLETED'. It includes fields for Task Time, Location Description, and Task Description.
- Map:** A Google Maps view showing a city street grid with several blue location pins.
- Discussion:** A text input area for comments or messages.
- Assigned Users:** A list of users, currently showing 'valpatamias'.
- Reports:** A table listing task history with columns for Time, Type, and Description.
- List of Tasks:** A table showing a list of tasks with columns for Time, Category, and Description, each with a status indicator (e.g., 'Miss', 'Warn').
